

Attention to the approach of Jupiter and Saturn in this December!!

Night Vision Test Using Planets!!! Join us!

Get an observation certificate
with a beautiful photo!!

["I saw it" web-form]

From Dec. 1 to Dec. 31

How can you see Jupiter and Saturn? Observe and post your result!

★Points of observation★

- Watch by the naked eye (You may observe with glasses or contact lenses).
- Jupiter and Saturn can be seen in the low southwestern sky, so check in advance where that direction is not obscured from view.
- Looking at the starry sky for about 5 minutes, get accustomed to the outside environment (prepare for the night vision test).
- The appearance of Jupiter and Saturn may change depending on the brightness of the sky (or the brightness of the surroundings), so it is recommended to try (observe) several times in the evening of the same day. (Because Jupiter is brighter and begins to appear earlier than Saturn, there is a period of time when only Jupiter can be seen regardless of night vision.)
- Ward off COVID-19, keep a distance between people, and observe.
